AMENDMENTS TO THE CLAIMS

The listing of claims below replaces all prior versions, and listings, of claims:

1 1. (Previously Presented) A method for flexible allocation of a resource,
2 comprising the steps of:

3 associating a soft limit and a hard limit to a potential user of the resource
4 wherein the soft limit guarantees access to the resource by the potential user and the hard
5 limit enables the potential user to exceed the soft limit on a first-come-first-served basis;

6 obtaining a request for allocation of a portion of the resource for the
7 potential user;

8 granting the request if the request if allowed would not exceed the soft
9 limit of the potential user;

10 denying the request if the request if allowed would exceed the hard limit
11 of the potential user;

12 denying the request if the request if allowed would cause a grand total
13 allocation of the resource to exceed a high watermark assigned to the resource and
14 granting the request otherwise.

1 2. (Original) The method of claim 1, wherein the step of denying the request
2 if the request if allowed would cause a grand total allocation of the resource to exceed a
3 high watermark further comprises the step of entering a reduction mode for handling a
4 subsequent request for allocation of the resource.

1 3. (Original) The method of claim 2, wherein the reduction mode comprises
2 the step of:

3 granting the subsequent request if the subsequent request if allowed would
4 not exceed a soft limit associated with a potential user associated with the subsequent
5 request;

6 denying the subsequent request if the subsequent request if allowed would
7 exceed a hard limit associated with the potential user associated with the subsequent
8 request;

1 4. (Original) The method of claim 3, further comprising the step of assigning
2 the low watermark to the resource.

1 5. (Original) The method of claim 1, further comprising the step of assigning
2 the soft limit to the potential user.

1 6. (Original) The method of claim 5, wherein the step of assigning the soft
2 limit comprises the step of assigning the soft limit in response to a class associated with
3 the potential user.

1 7. (Original) The method of claim 1, further comprising the step of assigning
2 the hard limit to the potential user.

1 8. (Original) The method of claim 7, wherein the step of assigning the hard
2 limit comprises the step of assigning the hard limit in response to a class associated with
3 the potential user.

1 9. (Original) The method of claim 1, further comprising the step of assigning
2 the high watermark to the resource.

1 10. (Original) The method of claim 1, further comprising the step of allocating
2 a portion of the resource for system use.

1 11. (Original) A computer system, comprising:
2 resource;

Appl. No. 09/687,436
Amtd. dated July 19, 2004
Reply to Office Action of May 20, 2004

3 a set of resource allocation parameters for the resource including a high
4 watermark for the resource and a hard limit and a soft limit associated with a potential
5 user of the resource;

6 task that generates a request for allocation of a portion of the resource;
7 resource manager that in a normal mode grants the request if the request if
8 allowed would not exceed the soft limit and denies the request if the request if allowed
9 would exceed the hard limit and denies the request if the request if allowed would cause a
10 grand total allocation of the resource to exceed the high watermark and grants the request
11 otherwise.

1 12. (Original) The computer system of claim 11, wherein the resource
2 manager switches to a reduction mode if the request if allowed would cause the grand
3 total allocation to exceed the high watermark such that the resource manager grants all
4 subsequent requests that reduce a consumption of the resource while in the reduction
5 mode.

1 13. (Original) The computer system of claim 11, wherein the soft limit is
2 assigned to the potential user to guarantee access to the resource by the potential user.

1 14. (Original) The computer system of claim 11, wherein the hard limit is
2 assigned to the potential user to enable the potential user to exceed the soft limit on a
3 first-come-first-served basis.

1 15. (Original) The computer system of claim 11, wherein the resource
2 manager enters a reduction mode for handling a subsequent request for allocation of the
3 resource if the request if allowed would exceed the high watermark.

1 16. (Previously Presented) The computer system of claim 15, wherein the
2 resource manager in the reduction mode grants the subsequent request if the subsequent
3 request if allowed would not exceed a soft limit associated with a potential user
4 associated with the subsequent request and denies the subsequent request if the

5 subsequent request if allowed would exceed a hard limit associated with the potential
6 user associated with the subsequent request and denies the subsequent request if the
7 grand total allocation of the resource is above a low watermark associated with the
8 resource and grants the subsequent request if the grand total allocation is below the low
9 watermark.

1 17. (Original) The computer system of claim 16, wherein the resource
2 manager switches to the normal mode if the grand total allocation is below the low
3 watermark.
